DataChart[®] **6000 Series Paperless Recorders**

Data Security Statement

In order to maintain maximum data integrity, all data recorded to removable media is stored in a proprietary format. This allows for maximum data compression and ensures that data cannot be altered once it has been recorded.

Only Exhibitor Software for Windows and the Exhibitor Lite export utility can decode, display and export files recorded on DataChart 6000 Series recorders.

When data is exported using Exhibitor or Exhibitor lite a new file is created by converting the original file into a comma separated variable (CSV) format (the original file remains). Once in this format it can be imported into spreadsheet and data base applications for further analysis. It cannot however, be returned to the proprietary format once it has been exported. In addition, DataChart 6000 Series Recorders employ secured Audit Trail logs and have three levels of password protected security.
